Dateiinhalt / Vergleich

1	#!/bin/sh
2	
3	# An example hook script to validate a patch (and/or patch series) before
4	# sending it via email.
5	#
6	# The hook should exit with non-zero status after issuing an appropriate
7	# message if it wants to prevent the email(s) from being sent.
8	#
9	# To enable this hook, rename this file to "sendemail-validate".
10	#
11	# By default, it will only check that the patch(es) can be applied on top of
12	# the default upstream branch without conflicts in a secondary worktree. After
13	# validation (successful or not) of the last patch of a series, the worktree
14	# will be deleted.
15	#
16	# The following config variables can be set to change the default remote and
17	# remote ref that are used to apply the patches against:
18	#
19	# sendemail.validateRemote (default: origin)
20	# sendemail.validateRemoteRef (default: HEAD)
21	#
22	# Replace the TODO placeholders with appropriate checks according to your
23	# needs.
24	
25	validate_cover_letter () {
26	file="\$1"
27	# TODO: Replace with appropriate checks (e.g. spell checking).
28	true
